Vision (Small Project)

1. Introduction

The purpose of this document is to collect, analyze, and define high-level needs and features of **FrameRoom**. It focuses on the capabilities needed by photographers, clients, and crew members to overcome communication barriers and fragmented collaboration workflows in the photography industry. The details of how FrameRoom fulfills these needs are detailed in the use-case and supplementary specifications.

The introduction of the Vision document provides an overview of the entire document. It includes the purpose, core objectives, and references of this Vision document to guide the development process.

2. Positioning

2.1 Problem Statement

The problem of	the communication barrier in expressing visual concepts and the fragmentation in managing the photography collaboration workflow (from discovery and booking to feedback and delivery)
affects	clients (individuals, brands, event organizers) seeking photography services and service providers (photographers, studios)
the impact of which is	clients struggling to articulate their aesthetic tastes and evaluate if a photographer is a suitable match. Meanwhile, because references, messages, schedules, and feedback are scattered across multiple tools, both parties often face delayed deadlines, disputes over the project scope,..
a successful solution would be	creating a unified platform that connects both parties through authentic portfolios, centralizing the entire process of communication, brief finalization, photo proofing, and timeline management into a single Shoot Room to ensure transparent requirements.

2.2 Product Position Statement

For	photographers, studios, clients (individuals, brands)
Who	need to find partners matching their aesthetic tastes and professionally manage the entire photography collaboration workflow
The (product name)	FrameRoom
That	provides a unified platform to discover portfolios, synchronize ideas, and seamlessly manage the process from booking to final delivery

Unlike	current fragmented working tools (where messages, references, schedules, and feedback are easily scattered)
Our product	centralizes the entire workflow into a single Shoot Room, ensuring transparent progress.

3. Stakeholder and User Descriptions

3.1 Stakeholder Summary

Name	Description	Responsibilities
System Administrator	The operations team responsible for managing and monitoring the FrameRoom platform.	Handles user content reports; reviews and resolves requests regarding trust data and reviews when disputes arise between users. Ensures the platform maintains a safe and transparent collaboration environment.
Project Advisors	The lecturers who supervise the quality and feasibility of this academic project.	Monitors project progress; ensures the product meets academic standards and stays within the agreed project scope.
Development Team	The engineering/student team directly designing and building the FrameRoom platform.	Ensures the system is built according to business requirements; develops core features like the AI Search and Concept Studio; ensures maintainability and future scalability on both web and desktop environments.

3.2 User Summary

Name	Description	Responsibilities	Stakeholder
Photographer / Studio	Professionals or businesses providing photography services on the platform.	Showcases portfolios, reaches out to clients, introduces service packages, and manages bookings and project timelines.	Represents themselves.
Client	Individuals, models, brands, or event organizers seeking photography services.	Searches for photographers, develops visual concepts, books schedules, selects photos during the proofing phase, and receives the final products.	Represents themselves.

3.3 User Environment

Number of people involved: A typical task involves at least two primary users (a photographer and a client).

Task cycle: The collaboration cycle follows a structured workflow: discovering portfolios → finding a photographer → developing concepts → contacting and finalizing the brief → confirming the booking → collaborating in the Shoot Room → selecting and approving photos (proofing) → final delivery → reviewing.

Environmental constraints: Users need flexibility to manage projects from studios, offices, or on the go. Therefore, the application is designed to be responsive and accessible on both computer and mobile browsers. Additionally, sensitive workspaces like the Shoot Room and private galleries are constrained by strict access rights.

System platforms: The primary deployment environment is web-based. A desktop version packaged with Tauri is planned as a future extension.

Other applications in use: FrameRoom does not necessarily integrate with them; instead, it aims to replace and centralize these scattered workflows into a single unified platform.

3.4 Alternatives and Competition

Stakeholders and target users currently perceive the following alternatives to FrameRoom:

Maintaining the Status Quo (Fragmented Tools)

- **Description**: Users piece together their workflow using a combination of generic applications (e.g., messaging apps for communication, Pinterest for moodboards, Google Drive for delivery, and Google Calendar for scheduling).
- **Strengths**: These tools are free, universally accessible, and users are already highly familiar with them.
- **Weaknesses**: References, messages, schedules, and feedback are easily scattered across multiple tools. This lack of centralization makes it difficult to track progress, leads to miscommunication regarding the project scope, and results in unfair subjective reviews because actual workflow data is not recorded.

General Freelance & Commission Platforms (e.g., Fiverr, Upwork)

- **Description**: Broad marketplaces where clients can find and hire freelancers, including photographers or retouchers.
- **Strengths**: They offer large existing user bases, secure payment gateways, and established dispute resolution systems.
- **Weaknesses**: They do not cater specifically to the visual arts workflow. They lack specialized tools to help clients visualize ideas, and they do not have a dedicated Shoot Room tailored for visual proofing, timeline tracking, and aesthetic feedback.

Client Gallery & Proofing Platforms (e.g., Pixieset, Pic-Time)

- **Description**: Software designed for professional photographers to deliver high-quality galleries and allow clients to select or download final images.
- **Strengths**: Excellent for post-production delivery, featuring beautiful portfolio displays and specialized photo proofing capabilities.
- **Weaknesses**: These alternatives primarily focus on the end of the project lifecycle. They fail to address the pre-production matchmaking process, such as discovering photographers, generating moodboards, and establishing a unified Shoot Brief before the booking is confirmed.

4. Product Features

No.	*Feature*	*Description*	*Priority*
1	Profiles and Portfolios	Allows users to post photo collections by project, specify genres, styles, and crew credits, and clearly label authentic, manipulated, or AI-generated images.	High
2	Discovery and Smart AI Search	Enables natural language searches (e.g., "photographer shooting cold tone portraits in Thu Duc") combined with aesthetic matching and filters for region, services, budget, and availability.	Medium

3	AI Concept Studio	Assists users in generating briefs, moodboards, color palettes, and shot lists from descriptions or references, allowing photographers to evaluate technical feasibility before confirming the concept.	Medium
4	Services and Booking	Allows photographers to introduce service packages and clients to finalize a comprehensive Shoot Brief (covering location, budget, crew, and revision rounds) before confirming the booking.	High
5	Shoot Room and Messaging	Provides a dedicated workspace for each booking to exchange references, manage concepts, track team decisions, and record any authorized changes to the project scope.	High
6	Timeline and Deadline Tracking	Tracks project milestones (e.g., sending previews, retouching, delivery) with designated assignees.	High
7	Photo Proofing and Delivery	Allows clients to select photos in a preview gallery, leave notes at specific coordinates on the image, view retouching versions, and approve the final delivered products based on the agreed brief.	Medium
8	Review and Trust System	Links reviews to actual booking data (e.g., on-time delivery rate, number of revisions) to distinguish between subjective feelings and objective workflow metrics.	Low
9	Community Rooms	Provides spaces to follow creators, save works, discuss photography genres, share behind-the-scenes content, and seek collaborations.	Low
10	AI-Powered Smart Culling & Image Grouping	Utilizes lightweight computer vision algorithms to automatically extract features and cluster visually similar photos during the upload phase, streamlining the proofing process and reducing client decision fatigue.	Low

5. Non-Functional Requirements

Platform and Hardware Requirements: The system must operate as a web-based application accessible via computer and mobile browsers with a responsive interface. The web serves as the primary deployment environment, while the architecture must also support a future extension for a desktop version packaged with Tauri.

Security and Access Control: The platform must enforce strict role-based permissions. Access to the Shoot Room and private galleries must be restricted exclusively to authorized users.

Usability: The user interface must be fully responsive across mobile and desktop devices.

Performance and Reliability: All portfolio, booking, and communication data must be reliably synchronized through the backend. The timeline management system must be robust, accurately recording status changes - such as the waiting time for clients to select photos - to prevent incorrect delay attributions and ensure workflow reliability.
